

PACKAGE INCLUDES

Each Magic Flexible LED Light Sheet package includes the following. **Note that illustrations are not to scale.**

(1x) MAGIC LIGHT SHEET

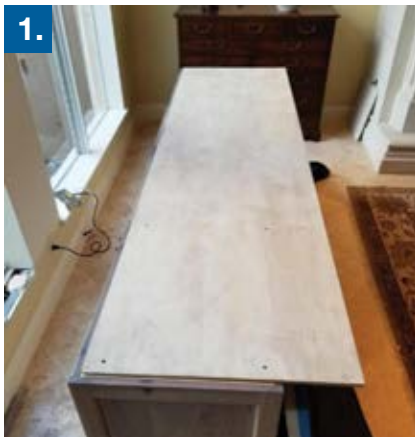

(1x) POWER LINKING CABLE

ADDITIONAL ACCESSORIES

Outwater recommends one Power Kit (sold separately) per sheet. Each Power Kit includes:

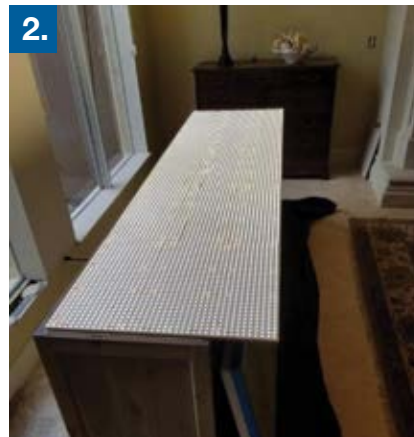

2x	10" Power Cable Bare Wires	4x	Cable Management Clips
4x	1.75" Sheet-to-Sheet Connection Wires	8x	Protective Bumpers
4x	6" Sheet-to-Sheet Connection Wires	6x	Screws & Plastic Gaskets

INSTALLATION

1. Before you begin, make sure that the surface you are installing the Magic Flexible LED Light Sheet to is clean and free of debris.

Measure the length, width, and height of the board and calculate how many Magic Flexible LED Light Sheets will be required for installation. Reminder that each sheet is 19.80" x 9.25".

2. The Magic Flexible LED Light Sheet can be attached to your substrate with the adhesive backing or screws (**sold separately**). After attaching the Light Sheet to the substrate, use the Sheet-to-Sheet connecting wires (**sold separately**) to provide power to the sheets.

Attach the protective bumpers (**sold separately**) to the Light Sheet. Outwater recommends using eight bumpers per Light Sheet (approximately six per square foot), spacing them evenly to distribute the weight of the material that will rest on top of them.

3. Turn the light panels on to test that they all light. If panels are not lit, check if the positive and negative connections are correct.

4. Place the marble slab on top of the protective bumpers. Enjoy your illuminated countertop.

INSTALLATION NOTES

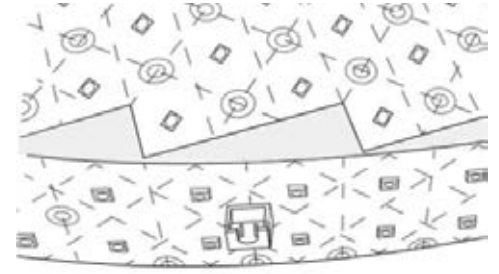

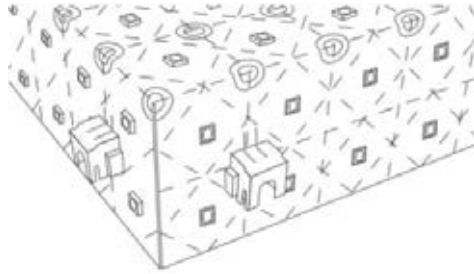

When attaching the Sheet-to-Sheet connectors (**sold separately**) to the receptacles you must connect Positive (+) to Positive (+) and Negative (-) to Negative (-).

Note: The Magic Flexible LED Light Sheet has indicators printed on it to help you determine which receptacles are Positive and Negative.

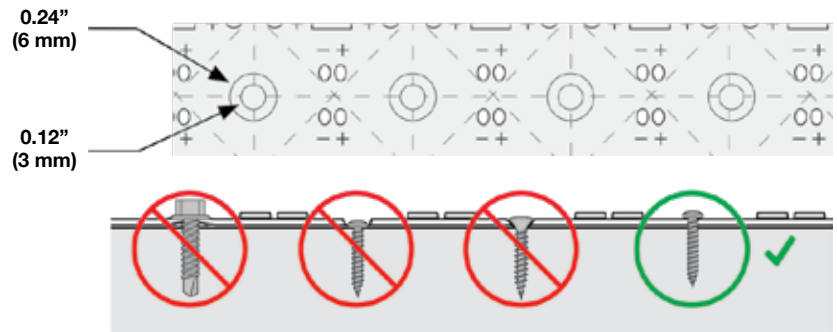

The Magic Flexible LED Light Sheet has many cutting lines printed on it which allow you to cut the sheet to any shape. The LED sheet can be cut using shears, scissors, a utility knife or a precision/craft knife. Cut the sheet along the horizontal, vertical, and/or diagonal lines. Do not deviate from the printed lines as this can cut off power from one or more LEDs.

To fold the LED sheet, bend the sheet along one of the dotted lines marked on the sheet. Make a crease along this line, then relax the crease to a 90° (or any desired) angle. Be careful when folding near where an LED is attached to the sheet as the LEDs can break if forced over an edge.

Do not repeatedly fold and unfold along the same line as this will weaken the Magic Flexible LED Light Sheet.

Do not fold a single Light Sheet and attach it to itself. Two separate Light Sheets may be attached back-to-back however.

The Magic Flexible LED Light Sheet can be adhered to a substrate two ways, either by the 3M double-sided adhesive tape, or with screws (**sold separately**).
